

Chemical structure of 2-(2-hydroxyethyl)pyrrolidine. The structure shows a five-membered pyrrolidine ring with a nitrogen atom (N) at the bottom. A 2-hydroxyethyl group is attached to the carbon atom adjacent to the nitrogen (C2). The bond length between the C2 atom and the adjacent carbon atom is highlighted in red and labeled as 0.970 Å.

Chemical structure of 2-(pyridin-2-yl)ethanol. The structure shows a pyridine ring connected to a two-carbon chain, which ends in a hydroxyl group (OH). The oxygen atom of the hydroxyl group is highlighted with a blue circle and labeled with a partial charge of 0.969.

Chemical structure of 2-((4-(hydroxymethyl)piperidin-1-yl)-6-(thiazol-2-yl)pyrimidin-3-yl)ethanol. The structure shows a thiazole ring connected to a pyrimidine ring, which is further connected to a piperidine ring. A hydroxymethyl group is attached to the piperidine ring. The molecule is labeled with a value of 0.969.
